

Press release 2005-08-09

## **LANspectre, a Swedish invention that inspects your network!**

**– Handheld instrument that quickly helps the technician to find out all devices connected to the Local Area Network.**

**LANspectre connects to an Ethernet network and scans quickly through the LAN for connected units like PCs, servers, printers, routers and so on. It presents on the display the units found with information about them as name, group, IP- and MAC-addresses. Start the web browser and call on the instrument if a better overview is required and get an even more detailed presentation and an excellent base for documenting the LANs IP-chart. The product is developed and produced in Sweden by people with long experience within Swedish IT-industry.**

The company T2C Marketing who launch LANspectre, views this as the first product in a family. LANspectre has a great advantage in that it in principle always is connected to the Internet whereby it is simple to upgrade and add new features to the instrument. The ambition is that the products should be easy to use and have a nice pricing which makes it reasonable for all IT-technicians to add to their toolbox.

- “We lacked a tool that could help you when the LAN was not working. The ones on the market were either aimed on measuring networking cabling or complex software demanding long education doing enormous charts and gathering too much LAN/WAN information. Our opinion is that it is not the cable that constitutes the problem in the LAN but more often it is the adjustments and the properties within the IP that constitutes the problem. We have just found one product able to present similar information as the LANspectre but in a complete different price range”, state Magnus Hansen, Managing Director at T2C Marketing AB.

LANspectre is developed for the international market and there are already interested parties in several European countries. The development of LANspectre has been in cooperation with Pontech Innovation whilst Rolf Kolmodin has contributed with the design. LANspectre is in the first place thought to be a tool for the network technician but new market segments constantly appears searching for the answers the instrument gives. In Sweden the main distributor for LANspectre is Deltaco, LANspectre Pro is expected to have a market price at about €250.
